Introduction

Nevada Assembly Bill 300 (AB300) Section 5(1) states that the Director of Veteran Services “prescribe a questionnaire for veterans concerning their experience in the military and any service-connected disabilities and diseases” and Section 5(2) states the Director “annually submit the information obtained through the questionnaire to the Division of Public and Behavioral Health of the Department of Health and Human Services on or before January 31st of each year”.¹

Section 5(1) states that the questionnaire must include questions in order to obtain the following data:

a. The veteran’s experience in the military, including, without limitation, the branch of the military in which the veteran served, the veteran’s job while in the military, any battle, conflict or war in which the veteran served and the locations where the veteran was stationed.

b. Any service-connected disabilities and diseases, including, without limitation, diseases presumed to be service-connected, from which the veteran may suffer.

c. Whether the veteran is enrolled with and receiving benefits from the United States Department of Veterans Affairs.

The questionnaire was made available on the Nevada Department of Veteran Services website, [https://veterans.nv.gov/](https://veterans.nv.gov/).

The Nevada Department of Health and Human Services, Office of Analytics annually publishes a special surveillance report on veteran health and suicide, which goes in depth into veteran deaths. For more information, please visit: [Office of Analytics](https://health.nv.gov/office-of-analytics/)

Methods

The questionnaire was available using Qualtrics online survey platform. The raw data was outputted from Qualtrics into an excel file on February 1st, 2021. The excel file was then uploaded into SAS (Statistical Analysis System) for data analysis.

There were 200 responses to the questionnaire between January 14th, 2020 and January 31st, 2021. An individual may have started the survey, stopped, and re-started later. Qualtrics logged all responses, regardless of whether an individual completed the survey or not, or how many times an individual took the survey before completing it. There is not a way to eliminate an individual’s partial surveys and only keep their completed survey, so all responses were included in the analyses. Therefore, the 200 responses may include multiple responses from the same individual.
Findings

Of the 200 responses to the Nevada veterans’ health survey, 119 were complete (60%) and 81 were incomplete (40%).

Figure 1. How Did You Hear About This Survey?

Nearly half of respondents heard about the survey directly from the Nevada Department of Veterans Services website (49%), followed by found on a search engine (20%).

Figure 2. In Which Branch of the Military Did You Serve?

An individual may have served in more than one branch of the military, therefore the counts represented in Figure 2 above are not mutually exclusive. Nearly 95% of respondents served in one
branch of the military, five percent served in two branches, and two percent served in more than two branches.

**Figure 3. Did You Serve During a Wartime Era?**

Most respondents had served during a wartime era (64%). The respondents were asked to list the wartime eras served, and a majority had either served during zero or one wartime. One respondent listed seven wartime eras served.

**Figure 4. Number of Wartime Eras Served.**
As illustrated in Figure 4, an individual may have served in more than one wartime era, therefore the numbers reflected in Figure 5 above are not mutually exclusive. Of the wartime eras listed, most had served during the Vietnam era, followed by the Gulf War, and Operation Enduring Freedom. When asked if they had served in direct combat operations, about one-third responded “no” (37%) and one-third responded “yes” (34%).

Figure 6. Have You Been Diagnosed with a Service-Connected Disability or Disease, Including Presumptive Condition(s)?

Approximately 42% of respondents answered that they had been diagnosed with a service-connected disability or disease, including presumptive conditions. According to the U.S. Department of Veterans Affairs (VA), presumptive service connections are disabilities and conditions that the VA presume were caused by military service, due to the “unique circumstances of a specific Veteran’s military service”.

</tbody>
</table>

Respondents were asked to list their service-connected disability or disease. The responses were diverse, with an array from headaches to different types of cancers.
Figure 7. Have You Been Rated by the VA for A Service-Connected Disability or Disease, Including Any Presumptive Condition(s)?

Approximately one-third of respondents responded “yes” to having been rated by the VA for a service-connected disability or disease, including any presumptive condition(s). According to the U.S. Department of Veterans Affairs, the VA assigns a veteran a disability rating “based on the severity of your service-connected condition”. ²

Figure 8. What is the Rating of the Service-Connected Disability or Disease, Including Any Presumptive Condition(s)?

The assigned rating is then used to determine disability compensation and other VA benefit eligibility. The rating is expressed as a percent. Of the 65 responses to the survey question, 25% of respondents (16) were rated at 100%.

<td>32%</td>
</tr>
<tr>
<td>Do you have a disability claim in process?</td>
<td>18%</td>
<td>48%</td>
<td>34%</td>
</tr>
</tbody>
</table>

About 36% of respondents reported receiving monthly monetary benefits from the VA, 45% receive health care from the VA, and 18% have a disability claim in process.

Conclusion

This report was based off responses from the first Veteran Health Survey. This survey had a total of 200 respondents, which is about 0.1% of the veteran population. Furthermore, only 119 survey responses (60%) were complete. According to the United States Census Bureau, there were 212,507 veterans living in Nevada in 2019.³ With a Nevada veteran population of 212,507, a confidence level of 95%, and a margin of error of 5 (plus or minus accounting for miscalculations, represented as a percent; 5 is standard), the survey sample size should be at least 383 respondents to draw meaningful conclusions.

Because this was the first year that the survey was conducted, and the survey will be available annually going forward, future years will conceivably be completed by more veterans and therefore the results will become more meaningful over time. However, this report does highlight the diverse service-connected diseases and disabilities with which veterans have been diagnosed, including eight forms of cancer, neuropathies, and various musculoskeletal pains. The responses were from veterans who served in 10 different wartime eras, were stationed in 10 different countries, and across five branches of the military.
